

GIT AND GITHUB, C++ DATA TYPES BASIC CONTROL FLOW

Problem Solving with Computers-I

<https://ucsb-cs16-wi17.github.io/>

C++

```
#include <iostream>
using namespace std;

int main(){
    cout<<"Hola Facebook\n";
    return 0;
}
```

Announcements

- Submit your homework 1
- Homework 2 has been released
- Reading for homework is due before each class
- Reminder about our policy on electronic devices
- Cookies during office hours – come visit!!
- Some comments on labs:
 - Please make sure you read ALL the information in the lab write up prior to coming to section
 - Start looking for partners to pair with in your section (for lab01) – We recommend using Piazza

Which of the reasons best describes why you are taking this class?

- A. You are a CS/CE major, and will be taking follow up classes
- B. You are NOT a CS/CE major, but are contemplating on switching into CS or CE
- C. Your major requires you to take the class. You are NOT a CS/CE major, are NOT contemplating on switching into CS or CE.
- D. Other - Just curious

What is Git and Github?

- **Git** is an example of “version control”
- **Git** performs version control on “repositories”
- **Repository (repo)** is just a collection of files
- **Github** is a repository hosting service for Git

Q: Can you suggest ways to store the three different versions of hello.cpp shown on the right?

```
#include<iostream>
```

```
int main() {  
}
```

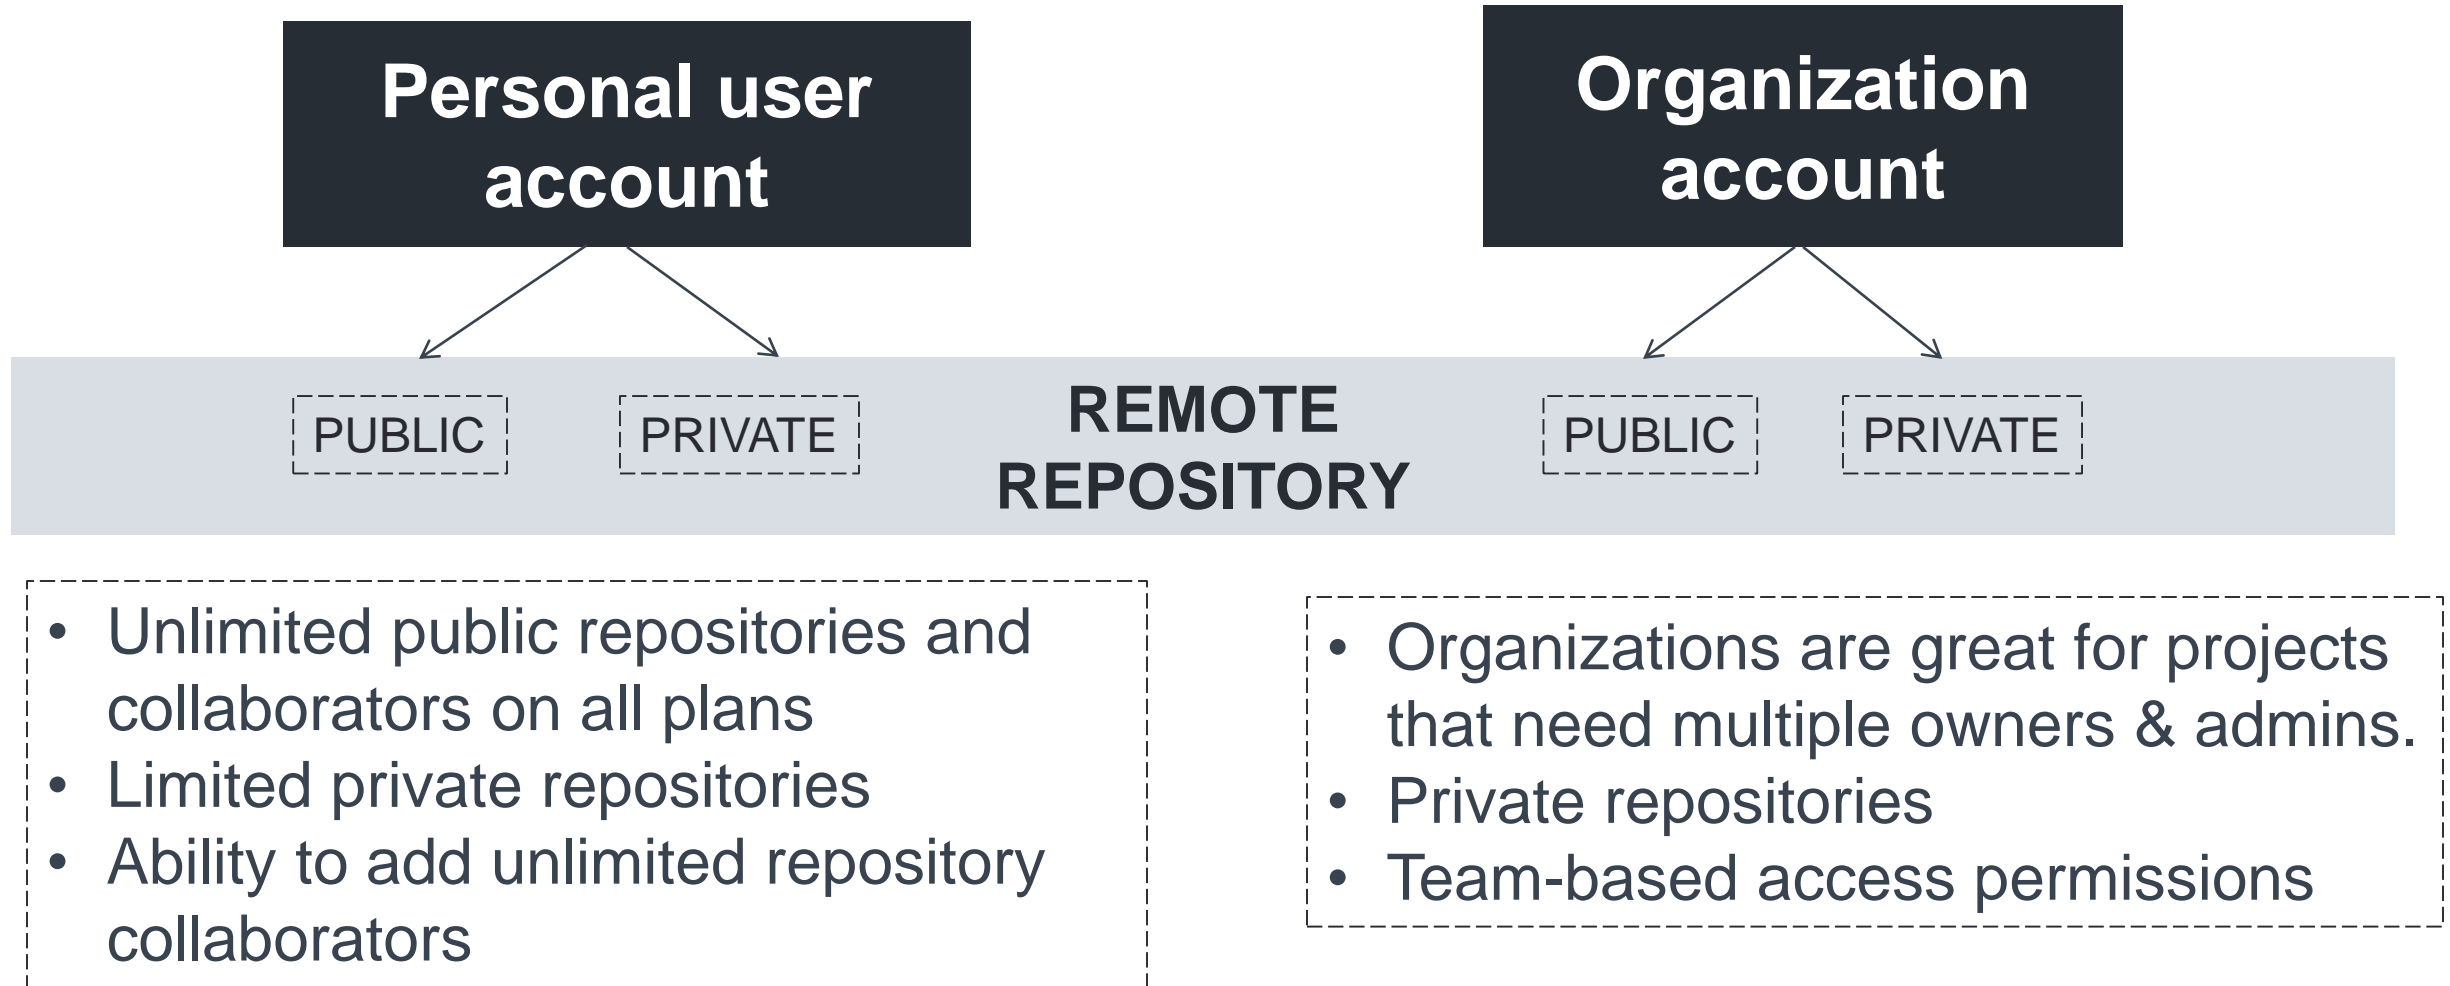

```
#include<iostream>
```

```
int main() {  
    cout<<“Hello World”;  
}
```

```
#include<iostream>
```

```
int main(){  
    cout<<“Hello World”<<endl;  
    return 0;  
}
```

Github Structure

Demo: creating a new repo in our class organization!

Cloning Repos

**REMOTE
REPOSITORY**

LOCAL REPOSITORY

Demo: Cloning as repo to CSIL servers and why that's useful

Clickers out – frequency AB

Which code produces a compile-time error?

A.

```
int main(){  
    cout<<"Enter two numbers:";  
    cin>>a >> b;  
    cout<<"The sum of "<< a << " and " << b<< " is:"<< a+b<<endl;  
}
```

B.

```
int main(){  
    int a, b;  
    cout<<"The sum of "<< a << " and " << b<< " is:"<< a+b<<endl;  
}
```

C.

Both **A** and **B**

D.

Neither **A** or **B**

C++ Variables and Datatypes

- **Variables** are containers to store data
- **C++** variables must be “declared” before they are used by specifying a datatype
 - `int`: Integers
 - `double`: floating point numbers
 - `char`: characters

```
int main() {  
  
    cout<<"Enter two numbers:";  
    cin>>a >> b;  
    cout<<"The sum of "<< a << " and " << b<< " is:"<< a+b<<endl;  
}
```

C++ Uninitialized Variables

- Value of uninitialized variables is “undefined”
- Undefined means “anything goes”
- Can be a source of tricky bugs
- What is the output of the code below?

```
int main() {  
    int a, b;  
    cout<<"The sum of "<< a << " and " << b<< " is:"<< a+b<<endl;  
}
```

Variable Assignment

- The values of variables can be initialized...

```
int myVariable = 0;
```

-or-

```
int myVariable;  
myVariable = 0;
```

Variable Assignment

- ...or changed on the fly...

```
int myVariable = 0;  
myVariable = 5 + 2;
```

Variable Assignment

- ...or even be used to update the same variable!

```
int myVariable = 0;  
myVariable = 5 + 2;  
myVariable = 10 - myVariable;  
myVariable = myVariable==0;
```

Variable Assignment

- ...or even be used to update the same variable!

```
int myVariable = 0;  
myVariable = 5 + 2;  
myVariable = 10 - myVariable;  
myVariable = myVariable==0;
```

Control Flow: if

- Find the main differences in each case
- Write the generalized if statement for each case

In Python

```
if True:  
    itIsTrue()
```

```
if True:  
    itIsTrue()  
    itIsAlsoTrue()
```

In C++

```
if (true)  
    itIsTrue();
```

```
if (true) {  
    itIsTrue();  
    itIsAlsoTrue();  
}
```

Generalized if statement

- The condition is a **Boolean expression**
- These can use relational operators

```
if ( condition ) {  
    // statement 1;  
    // statement 2;  
}
```

```
if ( 1 < 2 ) {  
    cout<< "foo" ;  
}
```

```
if ( 2 == 3 ) {  
    cout<<"foo" ;  
}
```

Will the same content be printed to standard output for both code instances provided below?

- A. Yes because the logic is equivalent
- B. Yes, but the logic is not equivalent
- C. No because the logic is not equivalent
- D. Both will produce a compile-time error

```
int myVar =0;  
  
if (myVar ==0)  
    cout<<"inside if\n";  
  
cout<<"outside if \n";
```

```
int myVar =0;  
  
if (myVar=0)  
    cout<<"inside if\n";  
  
cout<<"outside if \n";
```

Fill in the 'if' condition to detect numbers divisible by 3

- A. $x/3 == 0$
- B. $x\%3 = 0$
- C. $x\%3 == 0$
- D. None of the above

```
if ( _____ )  
    cout<< x << "is divisible by 3\n" ;  
}
```

Control Flow: if-else

```
if (cond) {  
    doOnTrue()  
    doThisAlso();  
} else {  
    doOnFalse();  
    doThisAlso();  
}
```

- Can you write this code in a more compact way

Control Flow: for loops

```
int x;
```

```
for ( x = 0; x < 50; x++ )  
    oneStatement( x );
```

```
for( x = 0; x < 50; x++ ) {  
    statementOne();  
    statementTwo();  
}
```
